Key Facts and Figures

- Improved reliability and performance of your business processes by proactive control of your IT Infrastructure and business applications

- Application specific business connectors to monitor any major application "agent-less"

- Automatic execution of "self-healing" workflow by integrating Universal Automation Center and theGuard! InterfaceManager and Business Service Manager

Real-time Automation Managment

Our joint solution is built on our core technologies. Stonebranch's Universal Automation Center (UAC) for Workload Automation and REALTECH's theGuard! As a business service manager you will get a solution that allows you to automate your entire business processes and, at the same time improve immediately reliability and performance.

REALTECH's theGuard!

theGuard! InterfaceManager and theGuard! Business Service Manager help and support the IT and the business to implement seamless and robust processes. They support Business Service Managers to proactively monitor the status, availability, events and performance of the entire Universal Automation Center in scheduling IT infrastructure as well as all relevant business process applications.

Universal Automation Center

Universal Automation Center is a modern, efficient automation solution that enables the monitoring of your IT processes including the proactive management of Universal Agents, Universal Automation Center Database, Universal Automation Center Tomcat and Universal Automation Center Network Infrastructure.

Business Process Applications

Relevant business process applications are monitored "agent-less" by specific business connectors, which exist for almost any major applications available e.g. SAP ERP, MS SQL, Oracle, SAP HANA, vSphere, Hyper-V, MS Exchange, Tomcat and Universal Agents.

Business do theGuard! Business Service Manager and UAC interact before a critical path is reached?

theGuard! Business Service Manager automatically interacts with Universal Automation Center to launch e.g. proactive "self-healing" workflow.

Example: SAP performance optimization

theGuard! Business Service Manager constantly monitors SAP performance parameters like e.g. work processes. Before a work process reaches a critical parameter, theGuard! automatically triggers in Universal Automation Center a workflow to reduce the number of parallelly started SAP jobs in order to reduce the SAP system load. Vice versa theGuard! Business Service Manager can automatically trigger Universal Automation Center to increase the number of parallelly executed SAP jobs.
